Facts About Eye Donation and Corneal Transplantation

The cornea, the clear surface at the front of the eye, is the main focusing element of the eye. If the cornea becomes cloudy from inherited disease, injury, infections, chemical burns, congenital disease, or many other causes, vision can be dramatically reduced. Not all donated eyes have corneas suitable for transplant. Sometimes a cornea may not be suitable for transplant because of the donor's medical history, or the cornea may have lost much of its opacity.

All eyes not used for transplant are used for valuable research or teaching programs. Human eyes are vital, and in many cases have no substitute, for the study of many ophthalmic problems, such as diabetes, glaucoma and retinal disease. An eye donation sometimes can be used for more than one purpose with the cornea being used for transplant and the rest of the eye for valuable research or training.

Overview of Statistics

In 1986, the 103 eye banks in the United States and Canada collected a total of 67,599 eyes and corneas (44,686 were whole eye donations while 22,913 were cornea-only donations). A record number of 31,340 corneas was supplied for transplant.

In 1985, 29,089 eyes were used for research and teaching programs. Another 7,387 corneas were provided for epikeratophakia, a surgical procedure that corrects refractive errors for patients with high degrees of vision loss. Of the total number of eyes and corneas donated, 46 percent were used for corneal transplants, 43 percent for research and teaching, and 11 percent for epikeratophakia.

The amount of eyes obtained in 1986 was a 22.0 percent increase over the previous record established in 1985. Much of this progress is due to increased public support for organ and tissue donation, especially in the growing number of states with laws requiring that the option of organ and tissue donation be considered in cases of hospital deaths (29 at this writing). In 1986, a record number of 31,340 corneas was supplied for transplant, 5,337 (20 percent) more than the previous record total established in 1985. Despite this progress, between 3,500 and 5,000 Americans still were waiting for transplants as of January 1, 1987 because of a shortage of donated corneas.

Table 1: Total Donations

	1985	1986
Whole Eyes	35,076	44,686
Corneal Only	20,528	22,913
All Donations	55,604	67,599
Corneal Grafts	26,326	31,340
Epikeratophakia	2,600	7,387
Donations for Research, Training	25,294 (96 eye banks)	29,089 (103 eye banks)

Variations in Activity Among Eye Banks

Eye banks vary greatly in the size of their territory, population, programs, staff, board of directors and medical advisors. The data in Table 2 support these differences.

Table 2: Total Eye and Corneal Donations Obtained by Eye Banks

	Number of Eye and Corneal Donations					
	0-99	100-299	300-599	600-999	1000-1999	2000+
# of Eye Banks 1985 (n=96)	19	21	30	13	8	5
% of Tot.Donations	1.6%	7.2%	21.4%	19.8%	19.4%	30.8%
# of Eye Banks 1986 (n=103)	19	23	28	13	13	7
% of Tot.Donations	1.3%	6.0%	17.9%	14.2%	29.7%	30.9%

The above figures indicate several trends:

(1) The number of small eye banks slowly is declining. In 1986, 66 percent of the eye banks obtained fewer than 600 donations, versus 73 percent in 1985.
(2) A signficant proportion of the eye banks (18 percent in 1986 versus 20 percent in 1985), still is obtaining less than two percent of the total eyes and corneas donated.
(3) 1986 brought a large increase in the percentage of eye banks obtaining 1,000 or more total eye and corneas (19 percent versus 14 percent in 1985).
(4) In summary, although a significant number of eye banks is obtaining a small volume of eyes, the trend is moving toward more eye banks becoming larger.

Comparison By Number of Grafts Performed

The demand for corneas for transplant varies greatly among the areas served by the various eye banks. Listed below are data for eye banks showing corneas used locally for transplant. The distribution of these changed significantly from 1985 to 1986 as more eye banks now are in the middle and largest categories.

Table 3: Eye Banks by Number of Grafts Performed Locally

	Number of Grafts				
	0-49	50-199	200-499	500-999	1000+
# of Eye Banks 1985 (n=96)	27	43	20	3	3
%of Eye Banks	28.1%	44.8%	20.8%	3.1%	3.1%
# of Eye Banks 1986 (n=103)	16	42	32	9	4
% of Eye Banks	15.5%	40.8%	31.1%	8.7%	3.9%

Eye Banks Sharing Corneas for Transplant

The first priority for the use of corneas, except in cases of emergency surgery, is in the local area where they are donated. Corneas are shared with other eye banks or corneal surgeons when a temporary surplus or a need exists. Corneas have to be transplanted within a week to 10 days after donation, depending on the method of storage. Unlike for organs, corneas, in over 90 percent of the cases, do not require tissue typing, so matching a cornea with a recipient is not as difficult.

A total of 21,050 of the eyes and corneas donated locally was used locally in corneal transplants, (a 10 percent increase over the 19,198 local transplants from tissue obtained locally in 1985). A total of 9,728 corneas was shared in 1985 (33.6 percent of surgical tissue), versus 10,290 corneas shared in 1986 (32.7 percent of surgical tissue). As in 1985, the majority of the shared corneas is shipped by a small number of eye banks. In 1986, the six eye banks sharing over 300 corneas accounted for 61.2 percent of the total, versus 64.8 percent by that group in 1985.

Of the 10,290 corneas shared for transplant, available distribution data (n=9,497) indicate 7,555 (80 percent) were shared in the United States and Canada, and 1,942 (20 percent) were shared outside of that area. The trend is toward more eye banks sharing a larger amount of corneas, although nearly half annually share fewer than 20.

Table 4: Eye Banks by Number of Corneas Shared for Transplant

	Corneas				
	0-19	20-49	50-99	100-299	300+
# of Eye Banks 1985 (n=96)	51	10	15	13	7
% of Eye Banks	53.1%	10.4%	15.6%	13.5%	7.3%
# of Eye Banks 1986 (n=103)	47	22	6	16	12
% of Eye Banks	45.6%	21.4%	5.8%	15.5%	11.7%

Eye Banks Receiving Shared Corneas

Eye banks receive shared corneas for surgery from another eye bank during those times when the local supply of corneas does not meet the local need. The distribution of those receiving shared corneas in 1986 nearly mirrors that in 1985. The percentage of shared corneas between these groups, however, is much different. For example, those who received over 200 shared corneas accounted for 40.0 percent of the total shared in 1985 versus 30.3 percent in 1986.

Table 5: Eye Banks by Number of Shared Corneas Received For Surgery

	Number of Grafts				
	0-19	20-49	50-99	100-199	200+
# of Eye Banks 1985 (n=96)	51	17	13	10	5
% of Eye Banks	53.1%	17.7%	13.5%	10.4%	5.2%
# of Eye Banks 1986 (n=103)	55	20	14	10	4
% of Eye Banks	53.4%	19.4%	13.6%	9.7%	3.9%

Limitations of This Report

Two eye banks did not report data, so their 1985 data were used. If available, this data would increase the total figures by less than two to three percent. All data are self-reported by each eye bank, so data are not included from other procurement agencies which obtain eyes or from physicians who obtain or receive eyes without using their local eye bank.

Conclusion

The purpose of eye banks is to have corneas readily available for anyone who needs a transplant, as well as to continue to supply tissue for valuable research and teaching programs. The improvements in eye banking in the 1980s, coordinated by the Eye Bank Association of America and eye banks, have greatly increased the number of people who can see due to corneal transplants and refractive surgery. Eye banking also has been assisted by the growing public support for organ and tissue donation, as evidenced by the the growing number of states with laws requiring that the option of organ and tissue donation be considered in cases of hospital deaths (29 at this writing). As more of these laws go in effect, expectations are that the number of eye donations will grow substantially.

The EBAA will continue to develop programming to maintain quality control in eye banking; to enhance public and professional education; to improve networking among eye banks; and to strengthen smaller eye banks. This dedication will assist eye banks in obtaining the large amount of tissue needed to eliminate the waiting list for sight-restoring surgery and to assist researchers in the discovery of treatments and solutions for many sight-hindering conditions.

EYE BANK ASSOCIATION of AMERICA

1987 EYE BANKING ACTIVITY - SETS RECORD

For Further Information, Contact:
Eye Bank Association of America
1725 Eye Street, N.W., Suite 308
Washington, D.C. 20006-2403
(202) 775-4999

Prepared: May 10, 1988

In 1987 a record number of 80,476 eyes and corneas was donated by humanitarian citizens, 19.0 percent higher than the previous record total of 67,599 in 1986. A record number of 35,930 corneas was supplied for transplant, 4,590 (14.6 percent) more than the previous record in 1986. This report details the sources and uses for these donations, and it offers an analysis of trends within eye banking.

Facts About Eye Donation and Corneal Transplantation

The cornea, the clear surface at the front of the eye, is the main focusing element of the eye. If the cornea becomes cloudy from inherited disease, injury, infections, chemical burns, congenital disease, or many other causes, vision can be dramatically reduced. Not all donated eyes have corneas suitable for transplant. Sometimes a cornea may not be suitable for transplant because of the donor's medical history, or the cornea may have lost much of its opacity.

All eyes not used for transplant are used for valuable research or teaching programs. Human eyes are vital, and in many cases have no substitute, for the study of many ophthalmic problems, such as diabetes, glaucoma and retinal disease. An eye donation sometimes can be used for more than one purpose with the cornea being used for transplant and the rest of the eye for valuable research or training.

Overview of Statistics

In 1987, the 107 eye banks in the United States and Canada collected a total of 80,476 eyes and corneas (55,633 were whole eye donations while 24,843 were cornea-only donations). A record number of 35,930 corneas was supplied for transplant, 4,590 (14.6 percent) more than the previous record in 1986.

In 1987, 35,427 eyes were used for research and teaching programs. Another 8,367 corneas were provided for epikeratophakia, a surgical procedure that corrects refractive errors for patients with high degrees of vision loss. Of the total number of eyes and corneas donated, 44.7 percent were used for corneal transplants, 44.0 percent for research and teaching, 10.4 percent for epikeratophakia and 0.9 percent after evaluation were discarded for patient safety purposes.

The amount of eyes obtained in 1987 was a 19.0 percent increase over the previous record established in 1986. Much of this progress is due to increased public support for organ and tissue donation, especially in the growing number of states with laws requiring that the option of organ and tissue donation be considered in cases of hospital deaths (43 at this writing).

Table 1: Total Donations

	1987	1986
Whole Eyes	55,633	44,686
Corneal Only	24,843	22,913
All Donations	80,476	67,599
Corneal Grafts	35,930	31,340
Epikeratophakia	8,367	7,387
Donations for Research, Training	35,427	29,089
	(107 eye banks)	(103 eye banks)

Variations in Activity Among Eye Banks

Eye banks vary greatly in the size of their territory, population, programs, staff, board of directors and medical advisors. The data in Table 2 support these differences.

Table 2: Total Eye and Corneal Donations Obtained by Eye Banks

	Number of Eye and Corneal Donations					
	0-99	100-299	300-599	600-999	1000-1999	2000+
# of Eye Banks 1987 (n=107)	17	24	24	17	14	11
% of Tot.Donations	1.1%	5.6%	13.3%	17.7%	23.2%	39.1%
# of Eye Banks 1986 (n=103)	19	23	28	13	13	7
% of Tot.Donations	1.3%	6.0%	17.9%	14.2%	29.7%	30.9%

The above figures indicate several trends:

(1) The number of small eye banks slowly is declining. In 1987, 61 percent of the eye banks obtained fewer than 600 donations, versus 66 percent in 1986.
(2) A signficant proportion of the eye banks (16 percent in 1987 versus 18 percent in 1986), still is obtaining less than two percent of the total eyes and corneas donated.
(3) 1987 brought a large increase in the percentage of eye banks obtaining 1,000 or more total eye and corneas (23 percent versus 19 percent in 1986).
(4) In summary, although a significant number of eye banks is obtaining a small volume of eyes, the trend is moving toward more eye banks becoming larger.

Comparison By Number of Grafts Performed

The demand for corneas for transplant varies greatly among the areas served by the various eye banks. Listed below are data for eye banks showing corneas used locally for transplant. The distribution of these changed significantly from 1986 to 1987 as more eye banks now are in the two largest categories.

Table 3: Eye Banks by Number of Grafts Performed Locally

	Number of Grafts				
	0-49	50-199	200-499	500-999	1000+
# of Eye Banks 1987 (n=107)	16	38	35	14	4
% of Eye Banks	15.9%	35.5%	32.7%	13.1%	3.8%
# of Eye Banks 1986 (n=103)	16	42	32	9	4
% of Eye Banks	15.5%	40.8%	31.1%	8.7%	3.9%

Eye Banks Sharing Corneas for Transplant

The first priority for the use of corneas, except in cases of emergency surgery, is in the local area where they are donated. Corneas are shared with other eye banks or corneal surgeons when a temporary surplus or a need exists. Corneas generally have to be transplanted within a week to 10 days after donation, depending on the method of storage. Unlike organs, corneas in over 90 percent of the cases do not require tissue typing, so matching a cornea with a recipient is not as necessary.

A total of 24,970 of the eyes and corneas donated locally was used locally in corneal transplants in 1987, (a 18.6 percent increase over the 21,050 local transplants from local donations in 1986). A total of 11,320 corneas was shared in 1987 (31.2 percent of surgical tissue), versus 10,290 corneas shared in 1986 (32.7 percent of surgical tissue), a 10 percent increase.

As in 1986, the majority of the shared corneas is shipped by a small number of eye banks. In 1986, the six eye banks which shared over 300 corneas accounted for 61.2 percent of the total, versus nine eye banks sharing over 300 corneas in 1987 which accounted for 55.7 percent of the total shared. The increase in those in the 50-99 and 100-299 categories accounts for most of the percentage drop by those in the 300 and over category (see Table 4).

Of the 11,333 corneas shared for transplant, 8,860 (78.2 percent) were shared in the United States and Canada, and 2,473 (21.8 percent) were shared outside of that area. The trend is toward more eye banks sharing a larger amount of corneas, although nearly half annually share fewer than 20.

Table 4: Eye Banks by Number of Corneas Shared for Transplant

	Corneas				
	0-19	20-49	50-99	100-299	300+
# of Eye Banks 1987 (n=107)	52	15	14	17	9
%of Eye Banks	48.6%	14.0%	13.1%	15.9%	8.4
# of Eye Banks 1986 (n=103)	47	22	6	16	12
% of Eye Banks	45.6%	21.4%	5.8%	15.5%	11.7%

Eye Banks Receiving Shared Corneas

Eye banks receive shared corneas for surgery from another eye bank during those times when the local supply of corneas does not meet the local need. The distribution of those receiving shared corneas in 1987 is different than that in 1986. More eye banks are receiving a lower number of shared corneas, a result probably due to the 19 percent increase in corneas procured for transplant by eye banks in 1987.

Table 5: Eye Banks by Number of Shared Corneas Received For Surgery

	Number of Grafts				
	0-19	20-49	50-99	100-199	200+
# of Eye Banks 1987 (n=104)	56	16	14	9	2
% of Eye Banks	61.7%	15.0%	13.0%	8.4%	1.9%
# of Eye Banks 1986 (n=103)	55	20	14	10	4
% of Eye Banks	53.4%	19.4%	13.6%	9.7%	3.9%

Sources of Donations

Data in this section are for all North American eye banks. Source data in 1986 are reported on 82 percent of the 44,686 whole eyes obtained and 99 percent of the 22,913 corneas obtained. Source data in 1987 are reported on 100 percent of the whole eyes and corneas obtained.

Table 6: Sources of Donations

	Whole Eyes		Corneas	
	1986 (36,487)	1987 (55,633)	1986 (22,514)	1987 (24,843)
Hospital	29,278 (80%)	48,484 (87%)	4,080 (18%)	7,712 (31%)
Funeral Director	5,509 (15%)	4,916 (9%)	348 (2%)	285 (1%)
Medical	763 (2%)	829 (1%)	18,086 (80%)	16,567 (67%)
Other Sources	937 (3%)	1,404 (3%)	0	279 (1%)

These data show some important trends in sources of donations.

1. The major increase in overall donations is in hospital donations. The growth in the impact of required request legislation undoubtedly has been the major factor in increasing whole eye donations in hospitals 66 percent and corneal donations 89 percent.

2. The decrease in donations from funeral director programs (-11 percent for whole eyes and -18 for corneas) and the 8 percent decrease in corneas donated throught the medical examiner programs are in large part related to more effective programs in hospitals which present the option of donation.

Limitations of This Report

Three eye banks did not report data, so their 1986 data were used. If available, this data would increase the total figures by less than two percent. All data are self-reported by each eye bank, so data are not included from other procurement agencies which obtain eyes or from physicians who obtain or receive eyes without using their local eye bank.

Conclusions

Despite the 13 percent increase in corneal transplants in the past year, between 3,500 and 5,000 Americans still were waiting for transplants as of January 1, 1988 because of a shortage of donated corneas.

Although the number of people on the list is about the same as January 1, 1987, the average time on the waiting list nationally is now between one and two months, less than half of the waiting time from the previous year.

The reasons for being on a waiting list for corneal transplant surgery are quite different from those for being on an organ transplant waiting list. Those waiting for organs do so because

of a more severe shortage of organs than corneas and because of the greater need for specific matching of medical characteristics between recipients and organ donors. People appear on a corneal transplant waiting list for several reasons. The major reason is that in many areas the demand for corneas for transplant exceeds the amount available. A small number of patients are waiting for antigen matched corneas to hopefully minimize the chances of rejection.

The purposes of eye banks are to have corneas readily available for anyone who needs a transplant, as well as to continue to supply tissue for valuable research and teaching programs. The improvements in eye banking in the 1980s, coordinated by the Eye Bank Association of America, the American Academy of Ophthalmology, other professional groups in transplantation and eye banks, have greatly increased the number of people who can see due to corneal transplants and refractive surgery. Eye banking also has been assisted by the growing public support for organ and tissue donation, as evidenced by the large number of states with laws requiring that the option of organ and tissue donation be considered in cases of hospital deaths (43 at this writing). As more of these laws go in effect, expectations are that the number of eye donations will grow substantially.

The EBAA will continue to develop programming to maintain quality control in eye banking; to enhance public and professional education; to improve networking among eye banks; and to strengthen smaller eye banks. This dedication will assist eye banks in obtaining the large amount of tissue needed to eliminate the waiting list for sight-restoring surgery and to assist researchers in the discovery of treatments and solutions for many sight-hindering conditions.
